`timeaszarvas.github.io`

Theoretical Linguistics Colloquium Vienna – November 7th 2025

ROADMAP

Today's goal:

Challenge the view that coreference resolution in multi-gap dependencies reflects principle C reconstruction and thus maps to the underlying syntactic derivation.

- Theoretical background
 - Multi-gap dependencies
 - Status of principle C reconstruction
 - Existing problems and how to approach them
- Experimental investigation
 - Research questions
 - Experiments: coreference judgments simple and multi-gap dependencies (English)
- What (I think) it all means and how we could move forward

ROADMAP

MULTI-GAP DEPENDENCIES

Across-the-board movement

An antecedent is related to a gap in each conjunct of a coordinate structure.

(Ross 1967)

- (1) Which paper did you file ____ and
Sally read ____?

- Systematic exception to the Coordinate Structure Constraint.
- ⇒ Movement must target both conjuncts of a coordinate structure.

Parasitic gaps

An antecedent is related to a main gap and another (optional) gap that is dependent on the first. (Engdahl 1983)

- (2) Which paper did you file ____
without reading *pg*?

- ⇒ Appear in domains that are subject to island effects.
- ⇒ Require an \bar{A} -moved antecedent that is related to a proper gap.

MULTI-GAP DEPENDENCIES

Across-the-board movement

An antecedent is related to a gap in each conjunct of a coordinate structure.

(Ross 1967)

- (1) Which paper did you file ____ and Sally read ____?
- Systematic exception to the Coordinate Structure Constraint.
- ⇒ Movement must target both conjuncts of a coordinate structure.

Parasitic gaps

An antecedent is related to a main gap and another (optional) gap that is dependent on the first. (Engdahl 1983)

- (2) Which paper did you file ____ without reading *pg*?
- ⇒ Appear in domains that are subject to island effects.
- ⇒ Require an \bar{A} -moved antecedent that is related to a proper gap.

MULTI-GAP DEPENDENCIES

Across-the-board movement

An antecedent is related to a gap in each conjunct of a coordinate structure.

(Ross 1967)

- (1) Which paper did you file ____ and Sally read ____?

- Systematic exception to the Coordinate Structure Constraint.
- ⇒ Movement must target both conjuncts of a coordinate structure.

Parasitic gaps

An antecedent is related to a main gap and another (optional) gap that is dependent on the first. (Engdahl 1983)

- (2) Which paper did you file ____ without reading *pg*?

- ⇒ Appear in domains that are subject to island effects.
- ⇒ Require an \bar{A} -moved antecedent that is related to a proper gap.

MULTI-GAP DEPENDENCIES

Across-the-board movement

An antecedent is related to a gap in each conjunct of a coordinate structure.

(Ross 1967)

- (1) Which paper did you file ____ and
Sally read ____?

- Systematic exception to the Coordinate Structure Constraint.
- ⇒ Movement must target both conjuncts of a coordinate structure.

Parasitic gaps

An antecedent is related to a main gap and another (optional) gap that is dependent on the first. (Engdahl 1983)

- (2) Which paper did you file ____
without reading *pg*?

- ⇒ Appear in domains that are subject to island effects.
- ⇒ Require an \bar{A} -moved antecedent that is related to a proper gap.

Superficial resemblance ⇒ Syntactic resemblance?

First noted by Ross (1967), recently reopened discussion by Altshuler and Truswell (2022)

ANALYSES OF ATB AND PGS

		Unificational	Non-unificational	
			ATB	PGs
Symmetric		Parallel extraction (Haik 1985; Huybregts and van Riemsdijk 1985; Seguin and Thoms 2025; Williams 1990); Multidominance Citko (2013); HPSG (Pollard and Sag 1994)	Parallel extraction (Biskup 2018; Hein and Murphy 2020; Wilder 1994; Williams 1978); Multidominance (Citko 2005)	
	Initial	Operator movement (Munn 1993, 1994, 1999, 2001)	Operator movement (Bošković and Franks 2000); Null pronominal (Zhang 2010); Ellipsis (Salzmann 2012)	Operator movement (Chomsky 1986; Nissenbaum 2000); Null pronominal (Cinque 1990); Fission & Fusion (Assmann 2012)
Asymmetric	Non-initial	Sideward movement (Altshuler and Truswell 2022; Hornstein and Nunes 2002; Nunes 1995, 2001)	Ellipsis (Ha 2008)	

Table 1: A bit of an empirical crisis: there is evidence for and against each of these approaches, they remain to coexist.

FREQUENTLY CITED EVIDENCE

FREQUENTLY CITED EVIDENCE

Against unification

PGs are more constrained,
typologically rare, often optional

In favor of unification

Only dependencies with multiple
gaps lacking c-command

FREQUENTLY CITED EVIDENCE

Against unification

PGs are more constrained,
typologically rare, often optional

Against asymmetry

Case matching/syncretism (Greek,
Hungarian, German)

In favor of unification

Only dependencies with multiple
gaps lacking c-command

In favor of asymmetry

WCO, Principle A reconstruction,
Principle C reconstruction

FREQUENTLY CITED EVIDENCE

Against unification PGs are more constrained, typologically rare, often optional	In favor of unification Only dependencies with multiple gaps lacking c-command
Against asymmetry Case matching/syncretism (Greek, Hungarian, German)	In favor of asymmetry WCO, Principle A reconstruction, Principle C reconstruction

Zooming in:

- **Principle C reconstruction** in ATB and PGs \Rightarrow Empirical facts?
- What do they imply for unification of ATB and PGs?
- What do they imply for symmetric vs. asymmetric derivations?

EVIDENCE: RECONSTRUCTION IN MULTI-GAP DEPENDENCIES

- Principle C: an R-expression must be free, i.e. must not be bound by a pronoun that c-commands it (Chomsky 1986) \Rightarrow **Disjoint reference!**

EVIDENCE: RECONSTRUCTION IN MULTI-GAP DEPENDENCIES

- Principle C: an R-expression must be free, i.e. must not be bound by a pronoun that c-commands it (Chomsky 1986) ⇒ **Disjoint reference!**
- Principle C reconstruction targets base positions (Sportiche 2017)

EVIDENCE: RECONSTRUCTION IN MULTI-GAP DEPENDENCIES

- Principle C: an R-expression must be free, i.e. must not be bound by a pronoun that c-commands it (Chomsky 1986) ⇒ **Disjoint reference!**
- Principle C reconstruction targets base positions (Sportiche 2017)

(3) *Principle C reconstruction (Nissenbaum 2000, p. 33)*

- a. *Which picture of John_i did Mary buy ____ and not let him_i look at ____?
- b. Which picture of John_i did Mary buy ____ without letting him_i look at *pg*?

EVIDENCE: RECONSTRUCTION IN MULTI-GAP DEPENDENCIES

- Principle C: an R-expression must be free, i.e. must not be bound by a pronoun that c-commands it (Chomsky 1986) ⇒ **Disjoint reference!**
- Principle C reconstruction targets base positions (Sportiche 2017)

	ATB	PGs
Nissenbaum (2000)	both gaps	only licensing gap
Citko (2005), Salzmann (2012)	only initial gap	NA
Bruening & Al Khalaf (2017)	both gaps ¹	both gaps ¹

- 1 Claim: Experimental data supports symmetry between conjuncts in ATB, but principle C reconstruction actually does not exist (no data for PGs provided, but claimed to behave like ATB)

CONFLICTING DATA REPORTS—WHY?

Coreference maps to reconstruction maps to underlying syntax ... right?

CONFLICTING DATA REPORTS—WHY?

Coreference maps to reconstruction maps to underlying syntax ... right?

Problem no. 1: Principle C reconstruction is tricky.

CONFLICTING DATA REPORTS—WHY?

Coreference maps to reconstruction maps to underlying syntax ... right?

Problem no. 1: Principle C reconstruction is tricky.

- The existence of principle C reconstruction with PP modifiers is hotly debated.
- The expected effect size is controversial \Rightarrow Unacceptability? Degradedness?
- Experimental designs differ, compromising data interpretability.

CONFLICTING DATA REPORTS—WHY?

Coreference maps to reconstruction maps to underlying syntax ... right?

Problem no. 1: Principle C reconstruction is tricky.

- The existence of principle C reconstruction with PP modifiers is hotly debated.
- The expected effect size is controversial \Rightarrow Unacceptability? Degradedness?
- Experimental designs differ, compromising data interpretability.

Problem no. 2: Incomplete data paradigms.

CONFLICTING DATA REPORTS—WHY?

Coreference maps to reconstruction maps to underlying syntax ... right?

Problem no. 1: Principle C reconstruction is tricky.

- The existence of principle C reconstruction with PP modifiers is hotly debated.
- The expected effect size is controversial \Rightarrow Unacceptability? Degradedness?
- Experimental designs differ, compromising data interpretability.

Problem no. 2: Incomplete data paradigms.

- Authors comparing ATB and PGs focus on non-initial gap across constructions.
 - Authors concerned with one of the two focus on both gaps within a construction.
- \Rightarrow We need to consider reconstruction to **both gaps in both constructions!**

A NOTE ON PRINCIPLE C RECONSTRUCTION

Recent experimental evidence:

✗ Adger et al. (2017)

✓ Stockwell et al. (2021, 2022)

✗ Bruening and Al Khalaf (2019)

✓ (Salzmann et al. 2023)

A NOTE ON PRINCIPLE C RECONSTRUCTION

Recent experimental evidence:

✗ Adger et al. (2017)

✓ Stockwell et al. (2021, 2022)

✗ Bruening and Al Khalaf (2019)

✓ (Salzmann et al. 2023)

Upshot: those who **isolate c-command** as a factor argue in favor of reconstruction; those who confound it with linear precedence argue against reconstruction.

A NOTE ON PRINCIPLE C RECONSTRUCTION

Recent experimental evidence:

✗ Adger et al. (2017)

✓ Stockwell et al. (2021, 2022)

✗ Bruening and Al Khalaf (2019)

✓ (Salzmann et al. 2023)

Upshot: those who **isolate c-command** as a factor argue in favor of reconstruction; those who confound it with linear precedence argue against reconstruction.

Working assumptions based on Szarvas (2025b):

- Coreference resolution depends on multiple syntactic and non-syntactic factors.

A NOTE ON PRINCIPLE C RECONSTRUCTION

Recent experimental evidence:

✗ Adger et al. (2017)

✓ Stockwell et al. (2021, 2022)

✗ Bruening and Al Khalaf (2019)

✓ (Salzmann et al. 2023)

Upshot: those who **isolate c-command** as a factor argue in favor of reconstruction; those who confound it with linear precedence argue against reconstruction.

Working assumptions based on Szarvas (2025b):

- Coreference resolution depends on multiple syntactic and non-syntactic factors.
- ⇒ Whether principle C reconstruction is detected to be one of them depends on the presence of context, alternative referents, task.

A NOTE ON PRINCIPLE C RECONSTRUCTION

Recent experimental evidence:

✗ Adger et al. (2017)

✓ Stockwell et al. (2021, 2022)

✗ Bruening and Al Khalaf (2019)

- Coreference resolution depends on multiple syntactic and non-syntactic factors.
- ⇒ Whether principle C reconstruction is detected to be one of them depends on the presence of context, alternative referents, task.

⇒ **Quantitative evidence needed to evaluate claims!**

EXPERIMENTAL FACTORS IN DETAIL

Factor 1: GRAMFUNC (object/subject)

- (4) a. [Which cousin of Max's] did Mary greet ____ and he hug ____? *object*
b. [Which cousin of Max's] ____ greeted Mary and ____ hugged him? *subject*

Factor 2: CONSTRUCTION (ATB/PG)

- (5) a. [Which cousin of Max's] did Mary greet ____ and he hug ____? *ATB*
b. [Which cousin of Max's] did Mary greet ____ before he hugged *pg*? *PG*

Factor 3: POSITION (initial/non-initial)

- (6) a. [Which cousin of Max's] did he greet ____ and Mary hug ____? *initial*
b. [Which cousin of Max's] did Mary greet ____ and he hug ____? *non-initial*

EXPERIMENTAL FACTORS IN DETAIL

Factor 1: GRAMFUNC (object/subject)

- (4) a. [Which cousin of **Max's**] did Mary greet ____ and **he** hug ____? *object*
b. [Which cousin of **Max's**] ____ greeted Mary and ____ hugged **him**? *subject*

Factor 2: CONSTRUCTION (ATB/PG)

- (5) a. [Which cousin of **Max's**] did Mary greet ____ and **he** hug ____? *ATB*
b. [Which cousin of **Max's**] did Mary greet ____ before **he** hugged *pg*? *PG*

Factor 3: POSITION (initial/non-initial)

- (6) a. [Which cousin of **Max's**] did **he** greet ____ and Mary hug ____? *initial*
b. [Which cousin of **Max's**] did Mary greet ____ and **he** hug ____? *non-initial*

EXPERIMENTAL FACTORS IN DETAIL

Factor 1: GRAMFUNC (object/subject)

- (4) a. [Which cousin of Max's] did Mary greet ____ and he hug ____? *object*
b. [Which cousin of Max's] ____ greeted Mary and ____ hugged him? *subject*

Factor 2: CONSTRUCTION (ATB/PG)

- (5) a. [Which cousin of Max's] did Mary greet ____ and he hug ____? *ATB*
b. [Which cousin of Max's] did Mary greet ____ before he hugged pg? *PG*

Factor 3: POSITION (initial/non-initial)

- (6) a. [Which cousin of Max's] did he greet ____ and Mary hug ____? *initial*
b. [Which cousin of Max's] did Mary greet ____ and he hug ____? *non-initial*

Anti c-command and anti-locality

Ban on parasitic gaps c-commanded by their licensing gap (Engdahl 1983).

Ban on subject PGs in monoclausal adjuncts (Davis 2025).

RESEARCH QUESTIONS

RESEARCH QUESTIONS

RQ1: Does principle C reconstruction predict preferences for pronominal reference?
⇒ Effect of GRAMFUNC on coreference judgment in simple wh-dependencies

RESEARCH QUESTIONS

RQ1: Does principle C reconstruction predict preferences for pronominal reference?

⇒ Effect of GRAMFUNC on coreference judgment in simple wh-dependencies

RQ2: Do the two gaps of ATB differ from the two gaps of a PG dependency?

⇒ Effect of POSITION × CONSTRUCTION on coreference judgment in ATB and PGs

RESEARCH QUESTIONS

RQ1: Does principle C reconstruction predict preferences for pronominal reference?

⇒ Effect of GRAMFUNC on coreference judgment in simple wh-dependencies

RQ2: Do the two gaps of ATB differ from the two gaps of a PG dependency?

⇒ Effect of POSITION × CONSTRUCTION on coreference judgment in ATB and PGs

RQ3: Is there evidence for principle C reconstruction in ATB dependencies?

⇒ Effect of GRAMFUNC × POSITION on coreference judgment in ATB dependencies

RESEARCH QUESTIONS

RQ1: Does principle C reconstruction predict preferences for pronominal reference?

⇒ Effect of GRAMFUNC on coreference judgment in simple wh-dependencies

RQ2: Do the two gaps of ATB differ from the two gaps of a PG dependency?

⇒ Effect of POSITION × CONSTRUCTION on coreference judgment in ATB and PGs

RQ3: Is there evidence for principle C reconstruction in ATB dependencies?

⇒ Effect of GRAMFUNC × POSITION on coreference judgment in ATB dependencies

⇒ Pilot study with 60 native speakers of English

~ Prolific, mean age 42.35

⇒ **54 participants** after exclusions

METHOD

- Single session \Rightarrow 28 target items (8+8+12),² 12 distractors and 3 training items.

Task 1: Forced choice between two interpretations.

Task 2: Acceptability judgment on 7-point scale.³

² 8 items from an experiment on the acceptability of PGs in finite vs. infinitival clauses, see appendix.

³ Acceptability judgments relevant for control items, see appendix.

METHOD

- Single session \Rightarrow 28 target items (8+8+12),² 12 distractors and 3 training items.

Task 1: Forced choice between two interpretations.

Task 2: Acceptability judgment on 7-point scale.³

Which client of Leo's tricked him?

What is this asking about?

- ☐ A client that tricked Leo. ☐ A client that tricked someone else.

² 8 items from an experiment on the acceptability of PGs in finite vs. infinitival clauses, see appendix.

³ Acceptability judgments relevant for control items, see appendix.

METHOD

- Single session \Rightarrow 28 target items (8+8+12),² 12 distractors and 3 training items.

Task 1: Forced choice between two interpretations.

Task 2: Acceptability judgment on 7-point scale.³

Which client of Leo's tricked him?

What is this asking about?

☐ A client that tricked Leo.

☐ A client that tricked someone else.

How acceptable is this sentence?

1 = completely unacceptable

7 = completely acceptable

- 2 8 items from an experiment on the acceptability of PGs in finite vs. infinitival clauses, see appendix.
- 3 Acceptability judgments relevant for control items, see appendix.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

RQ1: Does principle C reconstruction predict preferences for pronominal reference?

⇒ Effect of GRAMFUNC in simple wh-dependencies

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

RQ1: Does principle C reconstruction predict preferences for pronominal reference?

⇒ Effect of GRAMFUNC in simple wh-dependencies

- Single factor GRAMFUNC with two levels (object/subject)
- 8 items in two conditions each

⇒ Counterbalanced, each item seen in only one of the conditions

(8) *Item structure experiment 1*

a. Which client of Leo's did he trick?

object

b. Which client of Leo's tricked him?

subject

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

obj:

Which client of Leo_i's did he_i trick ____?

subj:

Which client of Leo_i's ____ tricked him_i?

Figure 1: Overall proportion of responses indicating preference for the coreferent reading in experiment 1.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

obj:

Which client of Leo_i's did he_i trick ____?

subj:

Which client of Leo_i's ____ tricked him_i?

- GRAMFUNC (***) \Rightarrow evidence for principle C reconstruction.
- Above chance proportion of coreference \Rightarrow bias to resolve pronominal reference in the absence of a suitable alternative (Gordon and Hendrick 1998)

Figure 1: Overall proportion of responses indicating preference for the coreferent reading in experiment 1.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

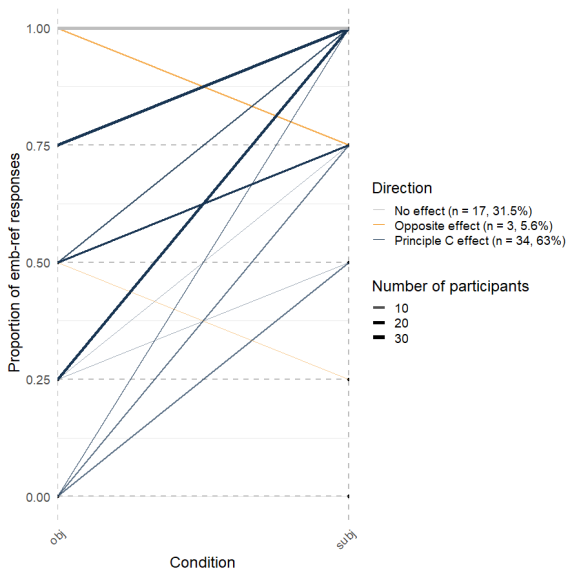

Figure 2: Individual participants' (n = 54) overall proportions of responses indicating coreference in experiment 1. Lines indicate individual participants' slopes between conditions.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

Finding 1: Evidence for principle C reconstruction in English wh-dependencies.

⇒ Preference for the coreferent reading is significantly decreased if the pronoun c-commands the base position of the R-expression.

Finding 2: No evidence for a strong syntactic violation forcing disjoint reference.

⇒ Reconstruction effect does not rule out coreference, it is still preferred overall (chosen in 59.7% of cases).

Finding 3: No evidence for universality of principle C reconstruction across speakers.

⇒ 37.1% of participants diverge from a principle C reconstruction effect.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

Finding 1: Evidence for principle C reconstruction in English wh-dependencies.

⇒ Preference for the coreferent reading is significantly decreased if the pronoun c-commands the base position of the R-expression.

Finding 2: No evidence for a strong syntactic violation forcing disjoint reference.

⇒ Reconstruction effect does not rule out coreference, it is still preferred overall (chosen in 59.7% of cases).

Finding 3: No evidence for universality of principle C reconstruction across speakers.

⇒ 37.1% of participants diverge from a principle C reconstruction effect.

EXP. 1: BASELINE FOR PRINCIPLE C RECONSTRUCTION

Finding 1: Evidence for principle C reconstruction in English wh-dependencies.

⇒ Preference for the coreferent reading is significantly decreased if the pronoun c-commands the base position of the R-expression.

Finding 2: No evidence for a strong syntactic violation forcing disjoint reference.

- POSITION (*) CONSTRUCTION (.)
- Lower coreference in PG than in ATB dependencies!
- Lower coreference in non-initial than in initial gaps!

Figure 3: Overall proportion of responses indicating preference for the coreferent reading in experiment 2.1.

EXP. 2.1: DIFFERENCE BETWEEN GAPS IN ATB AND PGS

Figure 4: Participant migration between effect groups (POSITION) in ATB and PG dependencies. Flow indicates change in individual participants' response pattern from ATB conditions to PG conditions.

EXP. 2.1: DIFFERENCE BETWEEN GAPS IN ATB AND PGS

Finding 1: Evidence for a difference between initial and non-initial gap.

⇒ Coreference rates are higher when the pronoun precedes the initial gap across dependency types.

Finding 2: Limited evidence for difference between ATB and PG dependencies.

⇒ Marginally significant effect of CONSTRUCTION, with higher overall coreference rates in ATB than in PG conditions.

Finding 3: Evidence for effect of construction complexity.

⇒ Greater preference for coreference in ATB and PG dependencies than in object condition of simple wh-dependencies in experiment 1.

Finding 4: No evidence for clear speaker profiles.

⇒ About half the participants show a consistent effect of POSITION, with the other half switching between a positive, negative effect or no effect.

EXP. 2.1: DIFFERENCE BETWEEN GAPS IN ATB AND PGS

Finding 1: Evidence for a difference between initial and non-initial gap.

⇒ Coreference rates are higher when the pronoun precedes the initial gap across dependency types.

Finding 2: Limited evidence for difference between ATB and PG dependencies.

⇒ Marginally significant effect of CONSTRUCTION, with higher overall coreference rates in ATB than in PG conditions.

Finding 3: Evidence for effect of construction complexity.

⇒ Greater preference for coreference in ATB and PG dependencies than in object condition of simple wh-dependencies in experiment 1.

Finding 4: No evidence for clear speaker profiles.

⇒ About half the participants show a consistent effect of POSITION, with the other half switching between a positive, negative effect or no effect.

EXP. 2.1: DIFFERENCE BETWEEN GAPS IN ATB AND PGS

⇒ Coreference rates are higher when the pronoun precedes the initial gap across dependency types.

Finding 2: Limited evidence for difference between ATB and PG dependencies.

⇒ Marginally significant effect of CONSTRUCTION, with higher overall coreference rates in ATB than in PG conditions.

Finding 3: Evidence for effect of construction complexity.

⇒ Greater preference for coreference in ATB and PG dependencies than in object condition of simple wh-dependencies in experiment 1.

Finding 4: No evidence for clear speaker profiles.

⇒ About half the participants show a consistent effect of POSITION, with the other half switching between a positive, negative effect or no effect.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

RQ3: Is there evidence for principle C reconstruction in ATB dependencies?

⇒ Effect of GRAMFUNC × POSITION in ATB dependencies

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

RQ3: Is there evidence for principle C reconstruction in ATB dependencies?

⇒ Effect of GRAMFUNC × POSITION in ATB dependencies

- Two factors with two levels each (GRAMFUNC: object/subject, POSITION: initial/non-initial)
- 12 items, 4 conditions (Latin Square)⁵

⁵ Again, the materials of exp. 2.1 and 2.2 are the same, we are looking at 4 out of 6 conditions in total, meaning there are 2 observations per condition for each participant.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

RQ3: Is there evidence for principle C reconstruction in ATB dependencies?

⇒ Effect of GRAMFUNC × POSITION in ATB dependencies

- Two factors with two levels each (GRAMFUNC: object/subject, POSITION: initial/non-initial)
- 12 items, 4 conditions (Latin Square)⁵

(10) *Item structure experiment 2.2*

- | | | |
|----|--|-------------------------|
| a. | Which cousin of Max's did he greet and Mary hug? | <i>ATB,init,obj</i> |
| b. | Which cousin of Max's did Mary greet and he hug? | <i>ATB,noninit,obj</i> |
| c. | Which cousin of Max's greeted him and hugged Mary? | <i>ATB,init,subj</i> |
| d. | Which cousin of Max's greeted Mary and hugged him? | <i>ATB,noninit,subj</i> |

5 Again, the materials of exp. 2.1 and 2.2 are the same, we are looking at 4 out of 6 conditions in total, meaning there are 2 observations per condition for each participant.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

ATB_{init,obj}:

Which cousin of Max_i's did he_i greet __ and Mary hug __?

ATB_{init,subj}:

Which cousin of Max_i's __ greeted him and __ hugged Mary?

ATB_{noninit,obj}:

Which cousin of Max_i's did Mary greet __ and he hug __?

ATB_{noninit,subj}:

Which cousin of Max_i's __greeted Mary and __ hugged him?

Figure 5: Overall proportion of responses indicating preference for the coreferent reading in experiment 2.2.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

Figure 5: Overall proportion of responses indicating preference for the coreferent reading in experiment 2.2.

ATB_init,obj:

Which cousin of Max_i's did he_i greet __ and Mary hug __?

ATB_init,subj:

Which cousin of Max_i's __ greeted him and __ hugged Mary?

ATB_noninit,obj:

Which cousin of Max_i's did Mary greet __ and he hug __?

ATB_noninit,subj:

Which cousin of Max_i's __greeted Mary and __ hugged him?

- POSITION (**) GRAMFUNC (**) POSITION × GRAMFUNC (*)
- Lower coreference in non-initial gap regardless of GRAMFUNC.
- Higher coreference in object condition compared to exp. 1 and PGs ⇒ even stronger bias to resolve pronominal reference.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

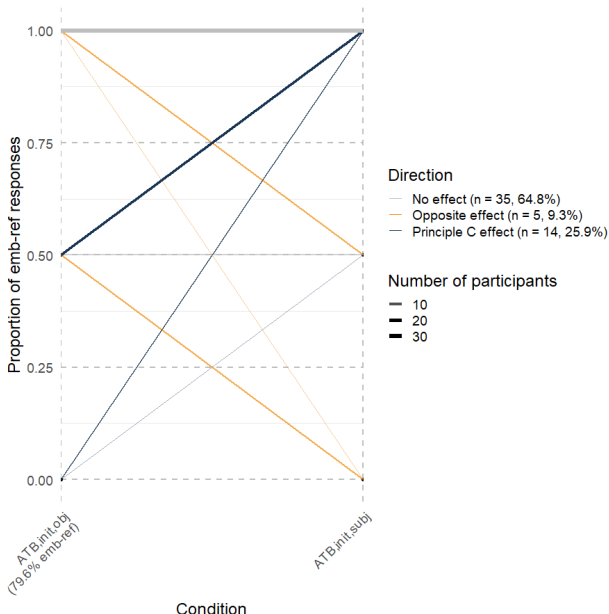

Figure 6: Individual participants' (n = 54) overall proportions of responses indicating coreference in experiment 2.2 in initial conjunct conditions. Lines indicate individual participants' slopes between conditions.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

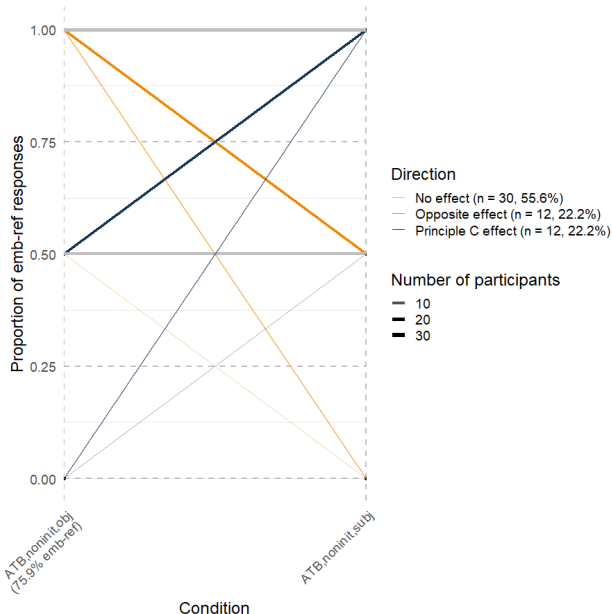

Figure 7: Individual participants' (n = 54) overall proportions of responses indicating coreference in experiment 2.2 in non-initial conjunct conditions. Lines indicate individual participants' slopes between conditions.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

Figure 8: Participant migration between effect groups (GRAMFUNC) in wh-dependencies (baseline), initial and non-initial conjunct of ATB dependencies. Flow indicates change in individual participants' response pattern from experiment 1 to initial and non-initial conditions of experiment 2.2.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

Finding 1: Evidence for principle C reconstruction only in initial gap.

- ⇒ Strictly speaking, POSITION \times GRAMFUNC is significant, and the direction of the effect matches the predictions of principle C reconstruction.
- ⇒ **Apparent lack of effect** in non-initial conjunct results from **increased variability!**

Finding 2: Evidence for effect of POSITION.

- ⇒ Reconstruction effects vanish at distance (cf. Adger et al. 2017; Stockwell et al. 2021).

Finding 3: No evidence for consistent speaker groups for reconstruction.

- ⇒ 14 + 12 participants show asymmetric effect, 5 show symmetric effect.
- ⇒ Majority of participants does not align with a principle C reconstruction effect.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

Finding 1: Evidence for principle C reconstruction only in initial gap.

⇒ Strictly speaking, POSITION \times GRAMFUNC is significant, and the direction of the effect matches the predictions of principle C reconstruction.

⇒ **Apparent lack of effect** in non-initial conjunct results from **increased variability!**

Finding 2: Evidence for effect of POSITION.

⇒ Reconstruction effects vanish at distance (cf. Adger et al. 2017; Stockwell et al. 2021).

Finding 3: No evidence for consistent speaker groups for reconstruction.

⇒ 14 + 12 participants show asymmetric effect, 5 show symmetric effect.

⇒ Majority of participants does not align with a principle C reconstruction effect.

EXP. 2.2: PRINCIPLE C RECONSTRUCTION IN ATB

Finding 1: Evidence for principle C reconstruction only in initial gap.

⇒ Strictly speaking, POSITION × GRAMFUNC is significant, and the direction of the effect matches the predictions of principle C reconstruction.

⇒ **Apparent lack of effect** in non-initial conjunct results from **increased variability!**

Finding 2: Evidence for effect of POSITION.

⇒ Reconstruction effects vanish at distance (cf. Adger et al. 2017; Stockwell et al. 2021).

Finding 3: No evidence for consistent speaker groups for reconstruction.

⇒ 14 + 12 participants show asymmetric effect, 5 show symmetric effect.

⇒ Majority of participants does not align with a principle C reconstruction effect.

METHODS-RELATED INCONSISTENCIES

Lower coreference rates in PG than ATB items.

Lower coreference rates in non-initial than initial gap conditions.

METHODS-RELATED INCONSISTENCIES

Lower coreference rates in PG than ATB items.

Lower coreference rates in non-initial than initial gap conditions.

- Szarvas (2024a, 2025a): opposite for coreference! Initial gap < non-initial gap in ATB.
- **Are the responses to the coreference and acceptability judgment task correlated?**

METHODS-RELATED INCONSISTENCIES

Lower coreference rates in PG than ATB items.

Lower coreference rates in non-initial than initial gap conditions.

- Szarvas (2024a, 2025a): opposite for coreference! Initial gap < non-initial gap in ATB.
- **Are the responses to the coreference and acceptability judgment task correlated?**

Models reveal significant (*) effect of each response variable on the other!**

⇒ Explains flipped pattern; easily avoided by presenting tasks in separate blocks.

KEY INSIGHTS

Empirical reports on similarities between ATB and PGs receive support.

Experiment 2.1: When only comparing cases *with a principle C violation under reconstruction*, the two gaps slightly differ within constructions.

But: this asymmetry does not arise due to principle C reconstruction.

Experiment 2.2: When *manipulating the presence of an underlying principle C violation*, we see that only 22-26% of speakers align with the predictions under ATB.

Experiment 1: Roughly 63% of participants align with the predictions in simple wh-dependencies, the effect size varies.

Related experiments on German depict the same pattern (Szarvas 2024a, 2025a).

Multiple roads lead to coreference.

General bias toward coreference, amplified by dependency complexity.

WHAT WE WERE LOOKING FOR VS. WHAT WE FOUND

Conclusions about the underlying syntax of ATB and PGs are unjustified.

⇒ The effect we observe is orthogonal to the question about the number of movement steps, the positions they target, and whether ATB and PGs are underlyingly derived in the same way.

If it is not reconstruction, what is it?

⇒ Linear or structural distance between R-expression and pronoun: Can be disambiguated by varying the position of the adjunct clause (cf. Pesetsky 1982; Szarvas 2024b).

- (11)
- a. I know which neighbor of Henry's he invited ___ in order for Mary to meet *pg*.
 - b. I know which neighbor of Henry's, in order for Mary to meet *pg*, he invited ___.
 - c. I know which neighbor of Henry's Mary invited ___ in order for him to meet *pg*.
 - d. I know which neighbor of Henry's, in order for him to meet *pg*, Mary invited ___.

WHAT WE WERE LOOKING FOR VS. WHAT WE FOUND

Conclusions about the underlying syntax of ATB and PGs are unjustified.

- ⇒ The effect we observe is **orthogonal** to the question about the **number of movement steps**, the **positions they target**, and whether ATB and PGs are underlyingly derived in the same way.

If it is not reconstruction, what is it?

- ⇒ Linear or structural distance between R-expression and pronoun: Can be disambiguated by varying the position of the adjunct clause (cf. Pesetsky 1982; Szarvas 2024b).

KEY INSIGHTS

Evidence from principle C reconstruction is **orthogonal** ⇒ Study has neutral implications.

Claims formerly supported:

- **(Non-)unification**
⇒ No clear evidence regarding similarity between constructions (e.g. Nissenbaum 2000).
- **Syntactic distinctness of gaps**
⇒ No clear evidence for workarounds via ellipsis/vehicle change (Salzmann 2012).

Claims formerly challenged:

- **Identity of gaps**
⇒ No clear evidence for two independent syntactic positions (cf. Citko 2005).
- **Parallel extraction**
⇒ No clear evidence for distinct syntactic material in gaps (cf. Seguin and Thoms 2025).

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

What data could reveal the underlying structure?

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

What data could reveal the underlying structure?

- (12) Principle C reconstruction with other configurations (cf. Moulton 2009):
- a. Whose painting John nude offended Mary and bothered him?
 - b. Whose painting John nude did Mary support and he regret?

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

What data could reveal the underlying structure?

- (12) Principle C reconstruction with other configurations (cf. Moulton 2009):
- a. Whose painting John nude offended Mary and bothered him?
 - b. Whose painting John nude did Mary support and he regret?
- Variable binding reconstruction (more stable, disambiguates approaches more clearly cf. Szarvas et al. under revision).

NEXT STEPS

Lack of evidence for asymmetry \neq Evidence in favor of symmetry

- The data **dismantle previous evidence** without favoring a specific derivation.

What data could reveal the underlying structure?

- (12) Principle C reconstruction with other configurations (cf. Moulton 2009):
- a. Whose painting John nude offended Mary and bothered him?
 - b. Whose painting John nude did Mary support and he regret?
- Variable binding reconstruction (more stable, disambiguates approaches more clearly cf. Szarvas et al. under revision).
 - More sophisticated (online) methods to avoid conscious strategies.

APPENDIX – THEORETICAL DETAILS

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** \Rightarrow parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** \Rightarrow parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)
- **Unificational empty operator movt.** \Rightarrow operator behaves like a trace of the element that licenses it (Munn 1994, p. 402)

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** \Rightarrow parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)
- **Unificational empty operator movt.** \Rightarrow operator behaves like a trace of the element that licenses it (Munn 1994, p. 402)
- **Sideward movement** \Rightarrow DP is copied from the adjunct clause of the PG/either conjunct of ATB before the two domains are connected

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** \Rightarrow parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)
- **Unificational empty operator movt.** \Rightarrow operator behaves like a trace of the element that licenses it (Munn 1994, p. 402)
- **Sideward movement** \Rightarrow DP is copied from the adjunct clause of the PG/either conjunct of ATB before the two domains are connected
- **Multidominance for ATB** \Rightarrow single DP is parallel merged in both domains.

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** \Rightarrow parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)
- **Unificational empty operator movt.** \Rightarrow operator behaves like a trace of the element that licenses it (Munn 1994, p. 402)
- **Sideward movement** \Rightarrow DP is copied from the adjunct clause of the PG/either conjunct of ATB before the two domains are connected
- **Multidominance for ATB** \Rightarrow single DP is parallel merged in both domains.
- **Ellipsis for ATB** \Rightarrow one of the DPs is elided, the other is extracted, allowing for vehicle change in ellipsis site (Fiengo and May 1994).

APPENDIX – THEORETICAL DETAILS

- **Parallel extraction** ⇒ parallel extraction from both domains, ‘two gaps created equal’ (operator + smuggling by Seguin and Thoms 2025 for PGs)
- **Unificational empty operator movt.** ⇒ operator behaves like a trace of the element that licenses it (Munn 1994, p. 402)
- **Sideward movement** ⇒ DP is copied from the adjunct clause of the PG/either conjunct of ATB before the two domains are connected
- **Multidominance for ATB** ⇒ single DP is parallel merged in both domains.
- **Ellipsis for ATB** ⇒ one of the DPs is elided, the other is extracted, allowing for vehicle change in ellipsis site (Fiengo and May 1994).
- **Empty operator movt. for PGs** ⇒ extraction only from matrix clause, empty operator has no internal structure

APPENDIX – EXP. 3: PARASITIC GAP ACCEPTABILITY

RQ4: Are parasitic gaps less acceptable in finite than non-finite adjunct clauses?

⇒ FINITENESS on acceptability rating in adjunct clauses with and without PG

APPENDIX – EXP. 3: PARASITIC GAP ACCEPTABILITY

RQ4: Are parasitic gaps less acceptable in finite than non-finite adjunct clauses?

⇒ FINITENESS on acceptability rating in adjunct clauses with and without PG

-
- Two factors with two levels each (FINITENESS: finite/infinitival; GAP: parasitic/pronoun)

APPENDIX – EXP. 3: PARASITIC GAP ACCEPTABILITY

RQ4: Are parasitic gaps less acceptable in finite than non-finite adjunct clauses?

⇒ FINITENESS on acceptability rating in adjunct clauses with and without PG

- Two factors with two levels each (FINITENESS: finite/infinitival; GAP: parasitic/pronoun)
- 8 items, 4 conditions (Latin Square)

(13) *Item structure experiment 4*

- | | | |
|----|--|-----------------|
| a. | Which movie did Sarah watch before she recommended? | <i>fin, pg</i> |
| b. | Which movie did Sarah watch before she recommended it? | <i>fin, prn</i> |
| c. | Which movie did Sarah watch before recommending? | <i>inf, pg</i> |
| d. | Which movie did Sarah watch before recommending it? | <i>inf, prn</i> |

APPENDIX – EXP. 3: PARASITIC GAP ACCEPTABILITY

Figure 9: Mean acceptability rating by condition in exp. 3.

Finding 1: Increased acceptability of infinitival clauses is marginally significant.

Finding 2: Interaction is not significant: no evidence for increased acceptability of PGs in infinitival clauses.

APPENDIX – EXP. 3: PARASITIC GAP ACCEPTABILITY

Max model exp. 3	Estimate (std. error)
finiteness	0.41(0.24)
gap	0.04(0.29)
finiteness:gap	0.05(0.74)
Num. obs.	432
Groups (participant)	54
Groups (item)	8
Variance: participant: (Intercept)	2.64
Variance: participant: finiteness	0.13
Variance: participant: gap	0.70
Variance: participant: finiteness:gap	2.27
Variance: item: (Intercept)	0.64
Variance: item: finiteness	0.02
Variance: item: gap	0.16
Variance: item: finiteness:gap	2.41

*** $p < 0.001$; ** $p < 0.01$; * $p < 0.05$

Table 2: Estimates of the cumulative link mixed effects model with symmetrical thresholds for experiment 4, including fixed effects for FINITENESS, GAP, and the interaction of the two, as well as random intercepts and slopes for items and participants. Threshold structure estimates omitted due to space, all significant (***).

APPENDIX – MODEL ESTIMATES EXP. 1

Max model exp. 1	Estimate (std. error)
(Intercept)	-3.05*** (0.38)
gramfunc	2.39*** (0.41)
Num. obs.	432
Num. groups: participant	54
Num. groups: item	8
Var: participant (Intercept)	2.97
Var: participant gramfunc	0.90
Var: item (Intercept)	0.06
Var: item gramfunc	0.31

*** $p < 0.001$; ** $p < 0.01$; * $p < 0.05$

Table 3: Estimates of the generalized linear mixed effects model for experiment 1, including fixed effect for GRAMFUNC and random intercepts and slopes for items and participants.

APPENDIX – MODEL ESTIMATES EXP. 2.1

Max model exp. 2.1	Estimate (std. error)
(Intercept)	-2.45*** (0.50)
position	1.06* (0.46)
construction	0.93(0.51)
position:construction	-0.22(0.60)
